The Nebraska Wind Energy and Wildlife Project submitted eight questions to the 2012 Nebraska Annual Social Indicators Survey (NASIS).

- 948 Nebraskans responded to the survey
- 151 (16%) were residents in the Lincoln Electric System (LES) service area
- All results listed in this handout are from LES residents

- 67% of LES respondents agree or strongly agree that wind energy facility development and operation should have to take precautions to reduce impacts on wildlife
- 15% disagree or strongly disagree that precautions should have to be taken

More LES respondents are very likely to recreate within sight of a turbine than within one mile of a turbine.
35% of LES respondents are concerned that birds and bats can be killed as a result of wind energy development.

18% are neither concerned nor unconcerned.

38% are unconcerned that birds and bats can be killed as a result of wind energy development.

LES respondents are more likely to pay $2 more a month on their electric bill to support wind energy if it is planned in a way that reduces impacts to wildlife.
